E-RIHS.it
EUROPEAN RESEARCH INFRASTRUCTURE
FOR HERITAGE SCIENCE

Humanities and Heritage Italian Open Science Cloud – H2IOSC

H2IOSC aims to create a federated and inclusive cluster of 4 Research Infrastructures (E-RIHS, DARIAH, CLARIN, OPERAS) in the ESFRI domain of social and cultural innovation to enable researchers from various disciplines in the fields of humanities, language technologies and cultural heritage to collaborate in research by sharing research tools, services and data.

Integrated platforms of the E-RIHS

Archlab:

Access to physical heritage science collections and archives, such as technical images, samples and reference materials, analytical data and conservation documentation, as stored in museums, galleries and research institutions.

Fixlab:

Access to large-scale and medium-scale facilities particle accelerators and synchrotrons, neutron sources; **non-transportable analytical instruments**.

Molab:

Access to an impressive array of advanced mobile analytical instrumentation for non invasive measurements on valuable or immovable objects, archaeological sites and historical monuments.

Digilab:

Virtual access to scientific data concerning tangible heritage, making them FAIR. It includes searchable registries of multidimensional images, analytical data and documentation.

DIGILAB: HUB FOR HS DATA

As part of the **H2IOSC** project, the primary objective of E-RIHS is to implement the last missing piece of the Research Infrastructure: the **DIGILAB** platform

DIGILAB is the digital infrastructure (**hardware and software**) of **E-RIHS** for the aggregation, interoperability, publication and redistribution of data, in accordance with European policies and international standards.

It will provide users with access to an interoperable ecosystem of data, tools and services to support the research, protection, conservation, enhancement and interpretation of cultural heritage

DATA ANALYSIS

Research Data vs Results

PUBLICATIONS AND DATA

Three main questions:

1. Where are the data used to find the scientific results presented in a publication?
2. How were they used?
3. How are they related to each other?

#1: Where are the data used to find the scientific results presented in a publication?

OneDrive

GDrive

Dropbox

iCloud

Do we really need another VIRTUAL DRIVE?

Is the capability of storing
and retrieving data
enough ?

#1: Preserve DATA FAIRNESS

Is it necessary to store all datasets in one or more federated repositories and ensure compliance with the principles of

FAIR DATA PRINCIPLES

FINDABLE

ACCESSIBLE

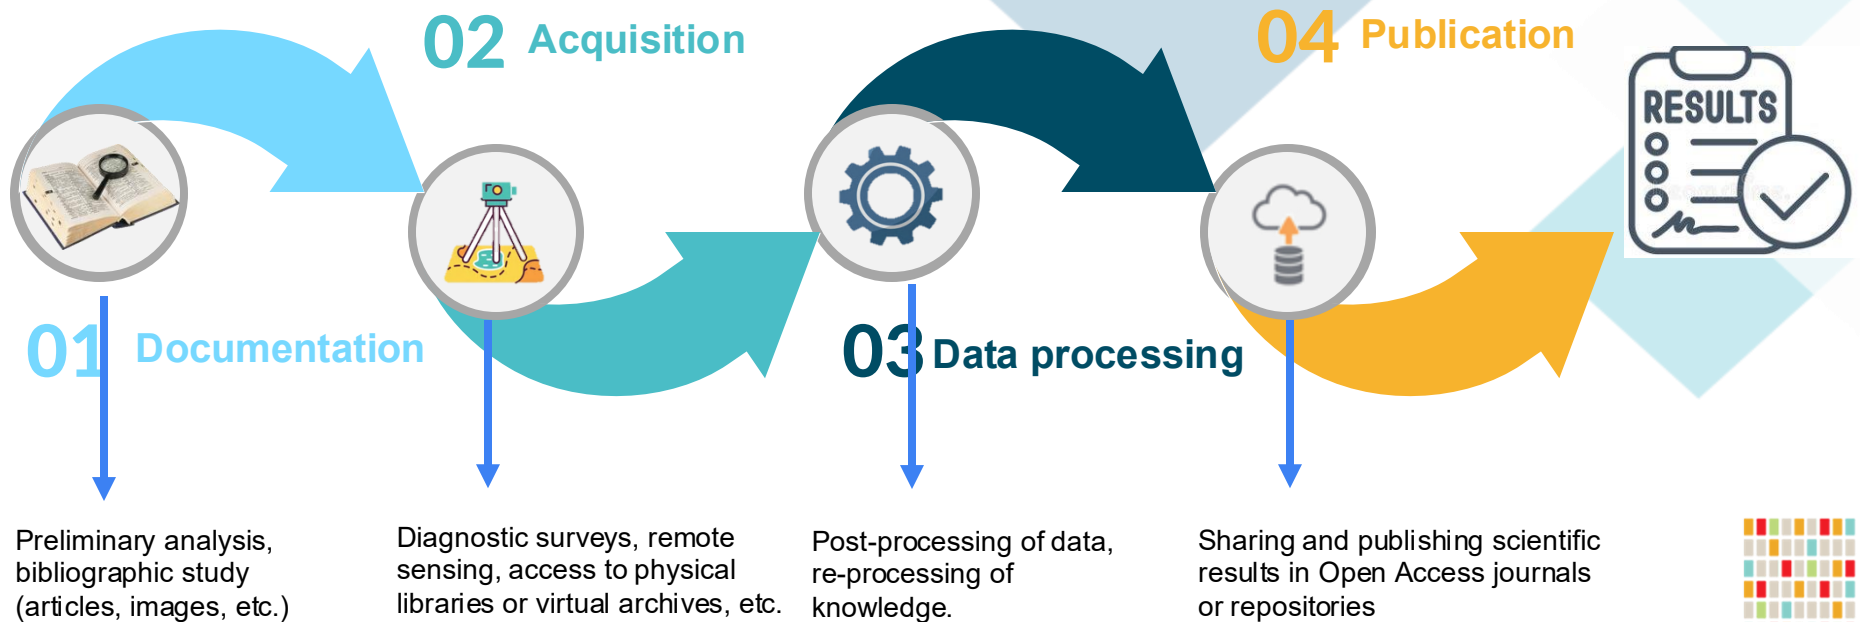

INTEROPERABLE

REUSABLE

#2: How were they used?

Save the scientific research WORKFLOW

#3: How are they related to each other?

Requirements

Needs

HS Community

8. Allow the **remote access and control** to physical instruments to conduct experimentations in real environments (**XVRE**)

7. Allow users to **collaborate** in a **shared workspace** in order to manipulate data, services, tools and workflows (**CVRE**)

6. Provide the capability of **combine services, tools and workflows** in order to create new ones (**VRE**)

5. Provide a set of **pre-configured** scientific workflows to the community

4. Support the **design** the **publication** and **execution** of **scientific workflows**

intended as sequence of steps of a generic scientific data creation process

3. Give access to data, digital tools and services provided by the HS research community through a visual and ergonomic interaction based of **3D knowledge graph**

2. Provide simple facilities to automatically build **forms** to help the **data input** and customized **reports**

1. Give users a personal data space to **store** his/her own **structured** data and metadata mapping them against one or more **ontologies** in form of a **Heritage Digital Twin (HDT)**
